Haley Hudgens

<div align="center">Project 2: Milestone2</div>

- Pseudocode and actual code used
    - random fact generator
        - I will use the Random().nextInt(int) method is get a random fact from an array of Strings for each planet.
    - Background transparent on image button
        - android:background="?android:selectableItemBackground"
- Most of my logic, images, and layout are in MS2 android studio project. However, las minute my R class stopped working so I cannot see the xml in design mode, but the app still builds.
- The last logic I need to work through is how the cases in the Planet Info class talk to the cases of planet each button being pressed in the ActivityMain
